

## **Deliverable**

You are expected to develop a small iOS application in Swift using Github RESTful APIs.

Please put your code to Github public repo.

## **Expected Goals**

Use this endpoint <https://api.github.com/events?page={page number}>

The app will have two views: one to show a list of events and one to show the event details.

When an event is clicked the details of event are displayed.

Details screen may have any structure and layout just enough to display the info

Display only basic attributes for an event in the list: author name, avatar, and date.

Add repository name to the above attributes for the event details screen.

List view will react to scroll and click events.

The app will use UITableView or UICollectionView for the list screen.

## **Requirements**

iOS 12 support

UIKit, MVC, Swift
